## TECHNICAL MEMORANDUM

**TO:** Ms. Alexis Oropeza, City of Hermosa Beach

CC: Mr. Amir Mikhail, Pacific Developments

**FROM:** Srinath Raju, P.E.

Christopher Muñoz

**SUBJECT:** Hermosa Beach Early Education Center Project - 210 Pacific Coast Highway

Traffic Operations and Parking Study Evaluation

**DATE:** April 24, 2024 **REF:** RA 764

Raju Associates was retained to provide an assessment of the proposed Hermosa Beach Early Education Center Project (Project) to address the City's request for evaluation of the following site issues:

- The proposed loading and unloading layout and demand.
- Employee parking area, vehicle queueing, if any, and impact on abutting right-of -way.
- Assess the demand turnover rate for load/unload of children during drop-off and pick-up.
- Identify whether the parking lot can handle the peak demand or identify operational layout
  or parking changes are needed. Identify if an alternative parking location(s), configuration,
  or parking assignment is needed. In the event that there is a need for additional parking to
  support the current demand for 77 children or a future expansion, explore off-site parking
  arrangement on neighboring properties in accordance with Hermosa Beach municipal
  code.

This technical memorandum provides a summary of the description of existing conditions, Project description, summary of the Project's trip generation estimates, and an evaluation and assessment of the Project's parking and loading/unloading area(s), and drop-off and pick-up operations. Additionally, VMT screening analysis and updated traffic and queueing analysis using new traffic counts at the Pacific Coast Highway/2<sup>nd</sup> Street intersection have been provided in this memorandum.

Based on an assessment of the above, the Project will provide adequate drop-off/pick-up spaces to accommodate the demand of the students. No traffic issues were identified at the Pacific Coast Highway/2<sup>nd</sup> Street intersection.

#### **EXISTING CONDITIONS**

The Project site is located at 210 Pacific Coast Highway (PCH) in the City of Hermosa Beach, California. The Project site is generally bounded by commercial and several residential uses to the north, 2<sup>nd</sup> Street to the south, PCH to the west and residential use to the east. The Project site and general vicinity are shown in Figure 1.

The existing site currently contains a retail auto showroom-body shop building. Two existing surface parking lots would serve the Project. One parking lot is located north of the building and is accessed from the driveway along PCH, while the other parking lot is located south of the building and is accessed from a driveway located along 2nd Street. As proposed, this existing building will be converted to a day care (early education center) facility.

## **Existing Street System**

A brief description of the roadways serving the Project Site including functional class, number of lanes, speed limits, and parking availability is presented in the following section.

- Pacific Coast Highway (PCH) PCH (SR-1) is classified as a major arterial highway and runs in a north-south direction. It defines the western frontage of Project Site. This roadway generally provides five travel lanes, three lanes in the northbound direction and two lanes in the southbound direction, during the morning peak commute period; and two lanes in the northbound direction and three lanes in the southbound direction during the evening peak commute peak period. Two travel lanes in each direction are provided during the non-peak commute hours with restricted parking on both sides of the street. Within the study area, restricted (non-metered) on-street parking is generally allowed on both sides of the street. The posted speed limit along this facility is 30 miles per hour.
- 2<sup>nd</sup> Street 2<sup>nd</sup> Street is a local roadway and defines the southern frontage of the Project Site. Adjacent to the Project Site, it provides two travel lanes, one lane in the eastbound and westbound directions. The roadway becomes one-way westbound approximately 150 feet east of PCH and provides neighborhood intrusion protection. The prima facie speed limit is 25 miles per hour. Due to the topography of 2<sup>nd</sup> Street, 15 miles per hour warning signs are posted along this roadway.

Image Source: Google Maps

FIGURE 1 LOCATION OF PROJECT SITE

### **Existing Pedestrian Circulation System**

The pedestrian circulation system includes crosswalks, intersection traffic control, and sidewalks available to serve pedestrians. PCH and 2<sup>nd</sup> Street offer pedestrian access and circulation possibilities to the Project Site. Sidewalks are available on both sides of PCH and 2<sup>nd</sup> Street near and adjacent to and in the vicinity of the Project site. The existing sidewalk/parkway along PCH adjacent to the Project Site is approximately 8 feet wide, while the existing sidewalk/parkway along 2<sup>nd</sup> Street is 5 to 8 feet wide. Pedestrian crosswalks adjacent to the Project Site are available at the nearby intersections of PCH/1<sup>st</sup> Street, PCH/2<sup>nd</sup> Street and PCH/3<sup>rd</sup> Street.

#### **Existing Transit Serving the Study Area**

One bus line operated by the Los Angeles County Metropolitan Transportation Authority (MTA/Metro) and one bus line operated by Redondo Beach - Beach Cities Transit (BCT) currently serve the vicinity of the Project Site. A list of these transit lines is provided below and illustrated in Figure 2.

- Metro Line 232 Metro Line 232 provides service from Long Beach to LAX and travels primarily along PCH within the study area.
- BCT Line 109 BCT Line 109 provides service from Redondo Beach Riviera Village to the LAX City Bus Center and travels primarily along Hermosa Avenue with the study area.

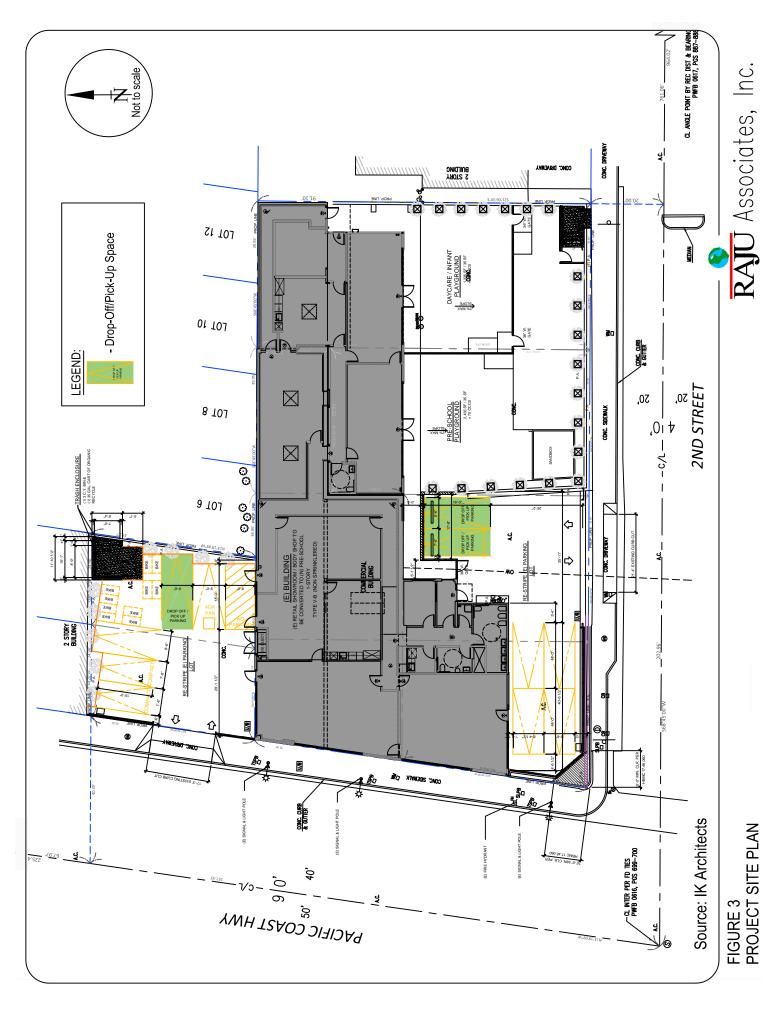

Bus stops serving Metro Line 109 nearest to the Project Site are located at the corners of the intersection of PCH/5<sup>th</sup> Street and PCH/Herondo Street; as well as bus stops located at the corners of the intersection of Hermosa Avenue/2nd Street that serve BCT Line 109.

#### PROJECT DESCRIPTION

The Project is located on the north-east corner of the intersection of PCH and 2<sup>nd</sup> Street in the City of Hermosa Beach, California. The Project consists of an early education center (day care) with a maximum enrollment of 77 students. A total of 11 vehicle parking spaces will be available on site at the two existing surface parking lots. Five vehicle parking spaces would be provided in the PCH parking lot, while 6 vehicle parking spaces would be provided in the 2<sup>nd</sup> Street parking lot. The Project site plan is shown in Figure 3.

FIGURE 2 EXISTING TRANSIT LINES

#### PROJECT PARKING REQUIREMENTS

Based on the City of Hermosa Beach Municipal Code Section 17.40.110 (A) – *Day Nursery, Preschools, and After School Child Care with Thirteen (13) or more Students*, the Project would need to provide 1 space for every seven (7) students. Therefore, the parking requirement for the Project is 11 spaces. The Project is providing a total of 11 parking spaces, satisfying the parking code requirement.

## **PROJECT PARKING LAYOUT**

As shown in Figure 3, the Project is proposing to provide 5 parking spaces in the PCH parking lot located north of the Project building consisting of one standard parking space, two compact parking spaces, one designated drop-off/pick-up (standard) space and one ADA van accessible parking space. Additionally, this parking lot would provide 10 bicycle parking spaces. The existing approximately 17-foot driveway along PCH would continue to provide access to this parking lot.

The Project is proposing to provide 6 parking spaces in the 2<sup>nd</sup> Street parking lot located south of the Project building consisting of two standard tandem parking spaces (a total of 4 spaces), one compact drop-off/pick-up space and one standard drop-off/pick-up space. The existing approximately 21-foot driveway along 2<sup>nd</sup> Street would continue to provide access to this parking lot.

Overall, a total of 8 parking spaces (including one ADA parking space) would be provided for staff/employees and 3 parking spaces would be designated for student drop-off/pick-up (unloading/loading).

#### **PROJECT TRIP GENERATION**

The Project consists of a day care center with a maximum enrollment of 77 students. Utilizing the Institute of Transportation Engineer's (ITE) Trip Generation Manual, 11th Edition, the Project's trip generation was determined. Table 1 presents details of the Project's trip generation including type of use, size, applicable rate, and trip generation estimates. Other calculations within the table also provide for trip generation reductions from walk trips.

From Table 1, it can be observed that the Project's trip generation would result in a net total of approximately 289 daily trips of which approximately 53 trips (28 inbound and 25 outbound) would occur during the morning peak hour and 53 trips (25 inbound and 28 outbound) would occur during the evening peak hour.

The ITE Trip Generation Manual, 11<sup>th</sup> Edition, also provides hourly distribution of vehicles entering and exiting a typical day care facility (see Attachment A). Based on these percentages, an hourly distribution of vehicles entering and exiting the Project Site is provided in Table 2. As indicated in Table 2, the peak hour during the morning drop-off period occurred between 7:00 AM and 8:00 AM with a total of 28 inbound trips and 25 outbound trips. This is consistent with the morning peak hour trip generation shown in Table 1.

It was also assumed from the ITE hourly distribution that the pick-up period occurred over a four-hour period between the hours of 2:00 PM and 6:00 PM. From Table 2, the peak hour during the evening pick-up period occurred at 5:00 PM with a total of 25 inbound trips and 28 outbound trips. This is consistent with the evening peak hour trip generation shown in Table 1.

## PROJECT DROP-OFF AND PICK-UP EVALUATION

This section provides an evaluation of the proposed drop-off and pick-up operations, an assessment of the demand turnover rate for unloading/loading students during drop-off and pick-up periods and identifies whether the parking lot can handle the estimated peak demand. This section also provides recommendations for the parking and operational layout to better serve the needs of the Project Site.

#### **Proposed Drop-Off and Pick-Up Operations**

As currently proposed, student drop-offs and pick-ups would occur in both parking lots. The PCH parking lot provides one parking space designated for drop-offs and pick-ups. Vehicles would enter from the driveway along PCH and park in the designated drop-off/pick-up space. The parent(s) would exit the vehicle and walk their child(ren) into the facility (drop-offs) or pick-up their child from the facility, return to their vehicle and exit right onto PCH.

TABLE 1
ESTIMATED PROJECT TRIP GENERATION

		Daily	Ā	AM Peak Hour	ır	ā	PM Peak Hour	'n

<b>Trip Rates</b> <sup>[1]</sup> Day Care Center (ITE Land Use 565)	Trips per student	[2]	23%	47%	[2]	47%	23%	[2]

[1] Trip Generation Manual, 11th Edition, ITE 2021.

[2] Trip generation estimates for Day Care Center (ITE Land Use 565) was calculated using the following equations:

Where:

Ln = Natural logarithm

T = Two-way volume of traffic (total trip-ends)

X = Number of students

Ln(T) = 0.87 Ln(X) + 0.29

T = 3.56 (X) + 47.23 T = 0.66 (X) + 8.42

Daily

AM Peak Hour: PM Peak Hour:

TABLE 2 ESTIMATED HOURLY DISTRIBUTION

			Vehicle Trips	
	Time Period	Total	Entering	Exiting
od [1]	7:00 - 8:00 AM	53	28	25
Drop-Off Period [1]	8:00 - 9:00 AM	38	19	19
Drop-	9:00 - 10:00 AM	14	8	7
[1]	2:00 - 3:00 PM	21	10	10
Pick-Up Period [1]	3:00 - 4:00 PM	21	11	10
ck-Up F	4:00 - 5:00 PM	40	20	19
Pic	5:00 - 6:00 PM	53	25	28

<sup>\*</sup> Based on ITE Trip Generation Manual, 11th Edition, Hourly Distribution of Entering and Exiting Vehicle Trips by Land Use Table, included in Attachment A.

<sup>[1]</sup> It was assumed from the ITE hourly distribution that the drop-off period occurred between the hours of 7:00 AM and 10:00 AM and the pick-up period occurred between the hours of 2:00 PM and 6:00 PM.

The 2<sup>nd</sup> Street parking lot provides two parking spaces designated for drop-offs and pick-ups. Due to the neighborhood traffic protection feature along 2<sup>nd</sup> Street, parents will be directed to enter 2<sup>nd</sup> Street from PCH to access the parking lot. Vehicles would enter from the driveway along 2<sup>nd</sup> Street and park in the designated drop-off space. The parent(s) would exit the vehicle and walk their child(ren) into the facility (drop-offs) or pick-up their child from the facility, return to their vehicle and exit right onto 2<sup>nd</sup> Street.

## **Drop-Off/Pick-Up Parking Space Turnover Rate**

For the purposes of this evaluation, a drop-off demand turnover rate of 5 minutes per vehicle per space during the morning peak hour was assumed. This is based on observations at other day care facilities where the demand turnover rate was 3-5 minutes. A pick-up demand turnover rate of 3-4 minutes (or 4 minutes) per vehicle space during the evening peak hour was assumed. This pick-up demand turnover rate of 3-4 minutes was also based on observations at other day care facilities.

## **Drop-Off/Pick-Up Parking Space Capacity vs Demand**

Table 3 provides a summary of the drop-off/pick-up space capacity by each schedule shift. As indicated in the table, based on a turnover rate of 5 minutes per vehicle per space and assuming a uniform arrival pattern, each space can accommodate up to 12 vehicles within each 60-minute drop-off morning period. The Project is providing a total of 3 drop-off/pick-up spaces and, therefore, would be able to accommodate a demand of approximately 36 vehicles during each 60-minute drop-off period. Similarly, the Project would be able to accommodate approximately 45 vehicles in the 60-minute pick-up evening time.

Based on the results of the trip generation evaluation, the Project is anticipated to generate approximately 25 drop-offs during the morning drop-off peak hour and approximately 25 pick-ups during the evening pick-up peak hour. Therefore, the proposed 3 drop-off/pick-up spaces would be adequate to serve the Project's projected demand.

City staff has requested that random arrivals be used and probabilities that the demand is three (3) or less and four (4) or more be determined. Random arrivals typically follow Poisson

## TABLE 3 **DROP-OFF/PICK-UP SPACES CAPACITY**

		Number of Vehicles		
Drop-Off Peak Hour	Minutes	(Capacity) <sup>[1]</sup>		
7:00 - 8:00 AM	60	36 vehicles*		
		(3 spaces x 60min/5 min)		
PROJECT AM PEAK I	HOUR DEMAND	25 vehicles		
	Number of Vehicles			
		Number of Vehicles		
Pick-Up Peak Hour	Minutes	Number of Vehicles (Capacity) <sup>[2]</sup>		
Pick-Up Peak Hour 5:00-6:00 PM	Minutes 60			
•		(Capacity) <sup>[2]</sup>		

<sup>\*</sup> Based on the provision of 3 drop-off/pick-up spaces.
[1] A turnover rate of 5 minutes per vehicle per space was assumed during the morning peak hour drop-off time period.

<sup>[2]</sup> A turnover rate of 4 minutes per vehicle per space was assumed during the evening pick-up peak hour time period.

Distribution. The Poisson Probability Density Function gives the probability of an event happening a certain number of times (k) within a given interval of time or space. Table 4 provides the Poisson distribution for random arrivals. As indicated in Table 4, there is an approximately 91 percent probability that the demand will be three (3) or less (parents dropping-off/picking-up their child(ren) at one time). The probability that the demand is four (4) or more is approximately 9 percent. Therefore, since more than 90 percent of the time, the demand would be three (3) or less, there would be adequate drop-off/pick-up spaces provided on site.

Although there is a small percentage of the peak times that the demand would be greater than the three (3) available drop-off/pick-up spaces, this would not have any impact of emergency vehicles. There would be adequate space for these emergency vehicles to get past other vehicles on 2<sup>nd</sup> Street, similar to what currently occurs.

## PROJECT VEHICLE MILES TRAVELED (VMT) AND OTHER ANALYSIS

The city staff requested that the Transportation Study also address VMT analysis and intersection level of service (LOS) and queueing analysis at PCH and 2<sup>nd</sup> Street. The city staff directed the applicant to conduct the VMT analysis using State guidelines. The following section addresses these elements.

#### VMT Analysis

The Governor's Office of Planning and Research (OPR) issued guidance on the technical aspects of SB 743 implementation. As part of the requirements, a new performance metric (VMT) was established for measurement of significant impacts under CEQA. The OPR's Technical Advisory, dated December 2019, stated that projects that generate less than 110 daily trips would be deemed to not cause significant transportation impacts.

Further, the advisory stated under *VMT Mitigation and Alternatives* section that potential measures to reduce vehicle miles traveled include the following:

 Increase access to common goods and services, such as groceries, schools, and daycare.

TABLE 4
POISSON DISTRIBUTION - RANDOM ARRIVALS FUNCTION

Probability(event)	k	P value	Cumulative P value
P(0)	0	0.186373976	0.186373976

is	$P(k) = (X^k)^*(e^-X)/k!$	
Mean value X =	1.68	

The proposed Day Care project includes 77 students replacing an existing use. The existing use could be retail or the last-known use (auto sales). Using the latest ITE 11<sup>th</sup> Edition Trip Generation Rates / Equations, the net trip generation estimates for the proposed Project with existing retail use credit and with existing auto sales credit were prepared. Tables 5 and 6 provide the net project trip generation for daily, AM and PM peak hours using existing retail credit and existing auto sales credit, respectively.

From Table 5, it can be observed that the project would generate fewer daily trips compared to the existing retail (65 less daily trips). Additionally, the project would generate less PM peak hour trips (3 trips less). During the AM peak hour, the project would generate approximately 19 trips inbound and outbound. Based on the project traffic assignment, it was estimated that the project would not cause any operational issues at the intersection of PCH and 2<sup>nd</sup> Street.

From Table 6, it can be observed that the project would generate a total of 94 daily trips. However, since the project would generate less than 110 daily trips, the project would be presumed to not cause any significant transportation impacts, according to the Governor's office of Planning and Research's Technical Advisory.

Finally, based on the net morning and evening peak hour trip generation and distribution, given the small amount of additional southbound left-turning movement traffic at the PCH/2<sup>nd</sup> Street intersection, it was estimated that there would be minimal operational effects associated with the Project and that the queue would not extend beyond the storage pocket. No further transportation analysis is necessary.

### **Intersection LOS and Queueing Analyses**

Weekday morning (AM) and evening (PM) peak hour traffic counts were compiled from data collected at the study intersection in April 2024, included in Attachment B. These traffic volumes reflect typical weekday operations during current year 2024 conditions. The intersection lane configurations and Existing (2024) peak hour traffic volumes are shown in Figure 4. The existing signal timing information was obtained from a recently completed traffic study (*PCH and 2<sup>nd</sup> Street – Proposed Starbucks Transportation Analysis Memorandum*, General Technologies Solutions, December 29, 2021, revised January 12, 2022) in the City of Hermosa Beach and verified using field observations.

FIGURE 4 EXISTING (2024) CONDITIONS - LANE CONFIGURATION AND PEAK HOUR TRAFFIC VOLUMES

RAJU Associates, Inc.

The intersection capacity analysis and queue analysis were conducted based on the Highway Capacity Manual (HCM) signalized intersection methodology utilizing Synchro 11 software. The HCM signalized methodology calculates the average control delay, in seconds, for each vehicle passing through the intersection.

LOS is a qualitative measure used to describe the condition of traffic flow, ranging from excellent conditions at LOS A to overloaded conditions at LOS F. LOS D is typically recognized as the minimum acceptable level of service in urban areas. The LOS definitions for signalized intersections are provided in Table 7.

**Existing (2024) LOS Analysis.** The Existing (2024) traffic volumes presented in Figure 4 for AM and PM peak hours were used in conjunction with the level of service methodologies described above, and the current intersection lane configurations (also illustrated in Figure 4), to determine the existing operating conditions at the analyzed intersection. The study intersection, PCH at 2<sup>nd</sup> Street, consists of two closely spaced intersections that operate under one controller. For this unique condition, Synchro 11 software cluster editor was utilized to simulate this condition.

Table 7 summarizes the results of the intersection capacity analysis for existing conditions. The table indicates the existing average control delay for each intersection during the morning and evening peak hours and the corresponding LOS. As illustrated in the table, the study intersection is currently operating at LOS B during both the morning and evening peak hours. The operational calculation worksheets for Existing (2024) conditions are provided in Attachment C.

**Project Trip Distribution and Assignment.** The Project's trip distribution was based on various factors such as project site location, points of access of the project driveways, availability of major and secondary arterials connecting to the regional roadway system as well as professional judgment and local knowledge of travel patterns within the study area.

Based on these distribution assumptions, location and points of access, and Project trip generation estimates (AM: 28 inbound trips, 25 outbound trips and PM: 25 inbound trips, 28 outbound) traffic estimates of project-only trips were developed. Note that the Project traffic assignments include walk trip credit and do not include existing use credit. The resulting net Project-only trips are also shown in Figure 5.

**LEVEL OF SERVICE AND QUEUE ANALYSIS**

\*These intersections are controlled by one traffic signal controller and have been evaluated as such utilizing Synchro 11 software intersection cluster editor.

[1] Delay based on HCM signalized intersection methodology reported in average seconds per vehicle. [2] Level of Service definitions for signalized intersections (source: Highway Capacity Manual, Transportation Research Board, 2016):

LOS: Average Delay (seconds/vehicle)

LOS A: < 10.0 seconds

LOS B: > 10.0 and < 20.0 seconds

LOS C: > 20.0 and  $\leq 35.0$  seconds

LOS D: > 35.0 and  $\le$  55.0 seconds LOS E: > 55.0 and  $\le$  80.0 seconds LOS F: > 80.0 seconds

[3] 95th-Percentile queue length from Highway Capacity Manual (HCM) methodology using Synchro 11 software.

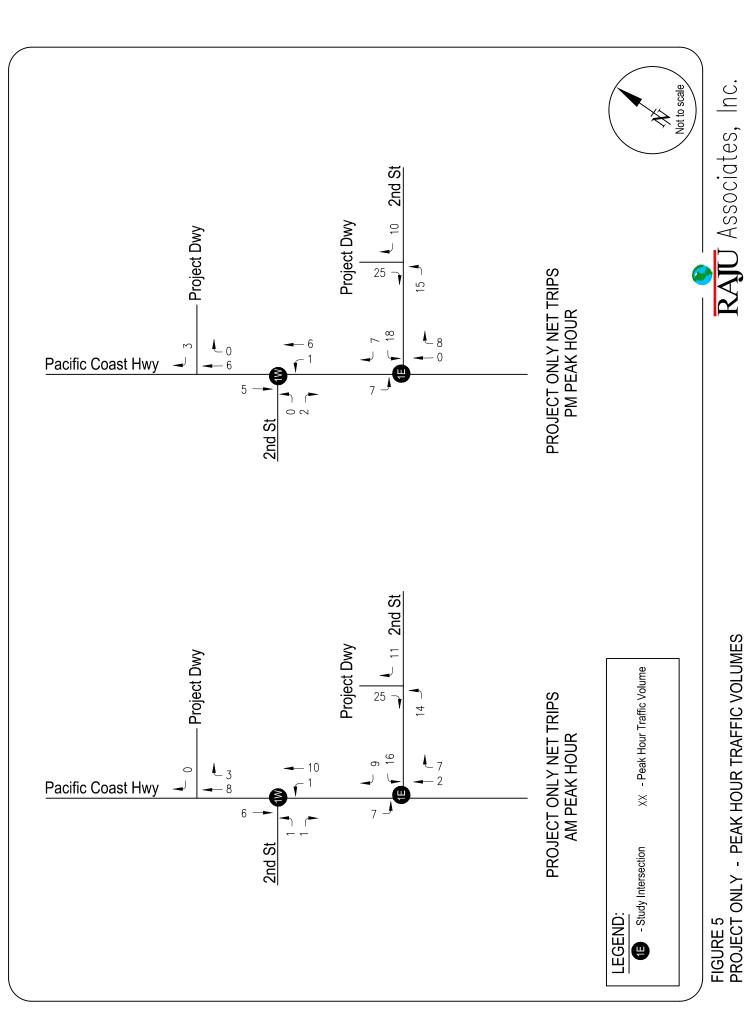

FIGURE 5 PROJECT ONLY - PEAK HOUR TRAFFIC VOLUMES

**Existing (2024) with Project Traffic Volumes.** The Existing (2024) traffic volumes were combined with the Project-only (net) traffic volumes to obtain the Existing with Project traffic volume forecasts presented in Figure 6.

Existing (2024) with Project LOS Analysis. The Existing (2024) with Project traffic volumes, presented in Figure 6, were analyzed to determine the intersection LOS and delay. Table 7 presents the results of the LOS analysis at the study intersections for existing conditions without and with Project. As summarized in Table 7, Existing (2024) with Project conditions analysis indicates that the Project's traffic does not change the levels of service at the study location compared to Existing (2024) conditions (without Project) during both the morning and evening peak hours. The operational analysis calculation worksheets for Existing (2024) with Project conditions are provided in Attachment C.

**Queue Analysis.** The city staff requested that the Transportation Study also provide a southbound left-turn queueing analysis at PCH and 2<sup>nd</sup> Street intersection. The HCM methodology for signalized intersections (in Synchro software) was utilized to calculate vehicle queuing for the southbound left-turn. The operational analysis reports the 95th percentile queue length (in feet) for the signalized intersections. This is a conservative analysis and does not represent what the average driver would experience, but it is a standard commonly used in traffic engineering design to determine lengths of turn lane pockets.

Table 7 summarizes the study intersection's southbound left-turn queues for Existing (2024) conditions and Existing (2024) with Project conditions. The southbound left-turn pocket has a storage length of approximately 25 feet. As indicated in Table 7, the southbound left-turn has a queue length of 2 feet during the morning peak hour and 1 foot during the evening peak hour under Existing (2024) conditions. With the addition of Project traffic, the southbound left-turn is projected to have a queue length of approximately 15 feet during the morning peak hour and approximately 10 feet during the evening peak hour. Therefore, the southbound left-turn pocket can accommodate the addition of the Project's traffic. No spillover from the southbound left-turn pocket into the through lane is anticipated.

FIGURE 6 EXISTING (2024) WITH PROJECT CONDITIONS - PEAK HOUR TRAFFIC VOLUMES

Additionally, the city has now requested the northbound left-turn queueing analysis. Table 7 also summarizes the study intersection's northbound left-turn queues for Existing (2024) conditions and Existing (2024) with Project conditions. The northbound left-turn pocket has a storage length of approximately 20 feet. As indicated in Table 7, the northbound left-turn queue length extends beyond the storage length under Existing (2024) conditions during both the morning (41 feet queue) and evening (80 feet queue) peak hours. The addition of Project traffic (one trip during both the morning and evening peak hours) would have no effect to minimal effect on the queue length during the morning peak hour (no change in queue length), and evening peak hour (3 feet increase in queue length), respectively.

#### Recommendations

The following recommended changes to the parking layout and operations have been provided in order to accommodate the Project's estimated demand during the drop-off/pick-up periods and provide safer and organized drop-off/pick-up operations.

- The Project should provide one centralized drop-off/pick-up area. This can be accomplished by removing the drop-off/pick-up space from the PCH parking lot. This space would be designated as a standard parking space. All drop-off/pick-up activities should occur at the 2<sup>nd</sup> Street parking lot. This will organize vehicles dropping off or picking up students to/from one area, thereby improving operations and safety.
- The Project should designate one additional drop-off/pick-up space in the 2<sup>nd</sup> Street parking lot. This space can be provided behind the tandem spaces, as shown in Figure 7. A total of 3 spaces would be designated as drop-off/pick-up spaces. This would result in relocating one standard parking space to the Project's parking lot along PCH.
- Based on comments from the city, the compact space in the 2<sup>nd</sup> Street parking lot would no longer be designated as a drop-off/pick-up space. An additional drop-off/pick-up space would be provided behind the remaining tandem space, as shown Figure 7.

FIGURE 7 RECOMMENDED PARKING LAYOUT CHANGES

RAJU Associates, Inc.

#### CONCLUSION

The Project would convert an existing retail vehicle showroom/body shop building into a day care center facility that would have a maximum enrollment of 77 students. The Project is anticipated to generate approximately 25 vehicle drop-offs during the morning drop-off peak hour and approximately 25 vehicle pick-ups during the evening pick-up peak hour. After implementation of the recommendations, the Project would provide a total of 3 drop-off/pick-up spaces at the Project's 2<sup>nd</sup> Street parking lot, which would be adequate for the proposed day care facility.

Based on Poisson distribution of random arrivals, there is an approximately 91 percent probability that the demand at the drop-off/pick-up spaces would be three (3) or less during peak times. The demand would have approximately 9 percent probability that it would be four (4) or more during peak times. Therefore, the recommended 3 drop-off/pick-up spaces would satisfy the Project's projected demand.

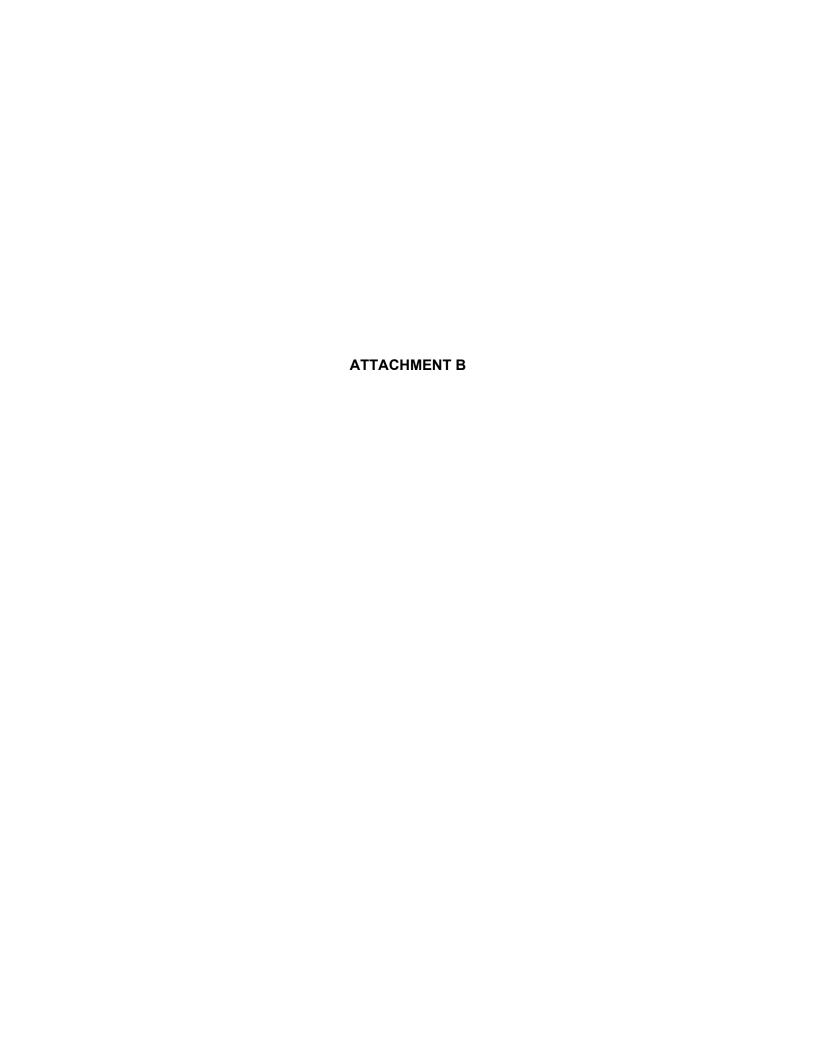

The proposed Project would be exempt from VMT analysis since the total net daily trips associated with the Project is less than 110 trips. The OPR guidelines also state that uses such as the proposed child day care project increases access to common goods and services, thereby reducing VMT and providing potential VMT mitigation. No further VMT analysis would be required for the Project.

Based on a level of service (LOS) evaluation at the PCH/2<sup>nd</sup> Street study intersection, the intersection is projected at LOS B during both the morning and evening peak hours under Existing (2024) with Project conditions, similar to Existing (2024) conditions. The queueing analysis at this location indicates that the southbound left-turn pocket can accommodate the addition of the Project's traffic and that no spillover from the southbound left-turn pocket into the through lane is anticipated. The effect of Project traffic on the PCH/2<sup>nd</sup> Street intersection operations would be minimal.
